

# CSCD 327: RELATIONAL DATABASE SYSTEMS

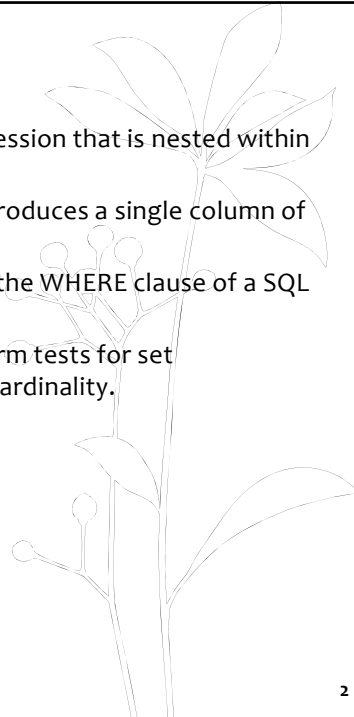

## SUBQUERIES

Instructor: Dr. Dan Li

## Nested Subqueries

- A **subquery** is a **select-from-where** expression that is nested within another query.
- In the most common uses, a subquery produces a single column of data as its query results.
- Subqueries are most frequently used in the WHERE clause of a SQL statement.
- A common use of subqueries is to perform tests for set membership, set comparisons, and set cardinality.

## Set Membership

- Find courses offered in Fall 2009 and in Spring 2010

This provides a way to implement INTERSECT.

- Find courses offered in Fall 2009 but not in Spring 2010

This provides a way to implement EXCEPT.

3

## Example Query

- Find the total number of (distinct) students who have taken course sections taught by the instructor with *ID* 10101
- Use JOIN
- Use subquery

This provides a way to avoid using JOIN.

4

## Set Comparison ( $=$ , $<>$ , $<$ , $<=$ , $>$ , $>=$ )

- Find names of instructors with salary greater than that of **some** (at least one) instructor in the Biology department.

- Same query using  $>$  **some** clause

By default, the comparison using  $>$  means greater than some, so the keyword **some** can be omitted.  
**Any** is the same as **some**.

5

## Definition of Some Clause

- $F < \text{comp} > \text{some } r \Leftrightarrow \exists t \in r \text{ such that } (F < \text{comp} > t)$   
 Where  $< \text{comp} >$  can be:  $<$ ,  $\leq$ ,  $>$ ,  $=$ ,  $\neq$

$$(5 < \text{some} \begin{array}{|c|} \hline 0 \\ \hline 5 \\ \hline 6 \\ \hline \end{array}) = \text{true} \quad (\text{read: } 5 < \text{some tuple in the relation})$$

$$(5 < \text{some} \begin{array}{|c|} \hline 0 \\ \hline 5 \\ \hline \end{array}) = \text{false}$$

$$(5 = \text{some} \begin{array}{|c|} \hline 0 \\ \hline 5 \\ \hline \end{array}) = \text{true}$$

$$(5 \neq \text{some} \begin{array}{|c|} \hline 0 \\ \hline 5 \\ \hline \end{array}) = \text{true (since } 0 \neq 5)$$

$(= \text{some})$  is the same as **in**  
 However,  $(\neq \text{some})$  is not the same as **not in**

6

## Example Query

- Find the names of all instructors whose salary is **greater than the** salary of **all** instructors in the Biology department.

7

## Definition of all Clause

- $F < \text{comp} > \text{all } r \Leftrightarrow \forall t \in r (F < \text{comp} > t)$

$$(5 < \text{all } \begin{array}{|c|} \hline 0 \\ \hline 5 \\ \hline 6 \\ \hline \end{array}) = \text{false}$$

$$(5 < \text{all } \begin{array}{|c|} \hline 6 \\ \hline 10 \\ \hline \end{array}) = \text{true}$$

$$(5 = \text{all } \begin{array}{|c|} \hline 4 \\ \hline 5 \\ \hline \end{array}) = \text{false}$$

$$(5 \neq \text{all } \begin{array}{|c|} \hline 4 \\ \hline 6 \\ \hline \end{array}) = \text{true (since } 5 \neq 4 \text{ and } 5 \neq 6)$$

( $\neq \text{all}$ ) is the same as **not in**

However, ( $= \text{all}$ ) is not the same as **in**

8

## Existence Test

- The **exists** construct returns the value **true** if the argument subquery is nonempty.
- **exists**  $r \Leftrightarrow r \neq \emptyset$
- **not exists**  $r \Leftrightarrow r = \emptyset$

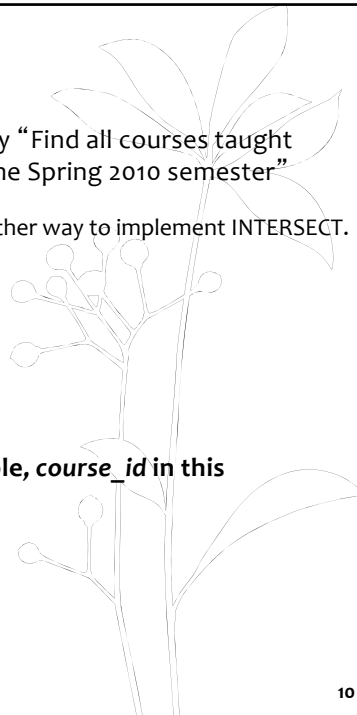

9

## Correlation Variables

- Yet another way of specifying the query “Find all courses taught in both the Fall 2009 semester and in the Spring 2010 semester”

This provides another way to implement INTERSECT.

- **Correlated subquery**
- **Correlation name** or **correlation variable**, **course\_id** in this example.

10

## Not Exists

- Find all students who have taken all courses offered in the Biology department.

How to implement division in SQL?

- Note that  $X - Y = \emptyset \Leftrightarrow X \subseteq Y$
- Note: Cannot write this query using **= all** and its variants

11

## Subqueries in the FROM Clause

- SQL allows a subquery expression to be used in the **from** clause
- Find the average instructors' salaries of those departments where the average salary is greater than \$42,000.

dept_name	avg_salary
Biology	72000.000000
Comp. Sci.	77333.333333
Elec. Eng.	80000.000000
Finance	85000.000000
History	61000.000000
Physics	91000.000000

- Note that we do not need to use the **having** clause in the above solution

12

## Subqueries in the FROM Clause (Cont.)

- And yet another way to write it: **lateral** clause

```
select name, salary, avg_salary
from instructor I1,
      lateral (select avg(salary) as avg_salary
              from instructor I2
              where I2.dept_name= I1.dept_name);
```

- Lateral clause permits later part of the **from** clause (after the lateral keyword) to access correlation variables from the earlier part.
- Note: lateral is part of the SQL standard, but is not supported on many database systems (e.g. MySQL); some databases such as SQL Server offer alternative syntax

13

## Subqueries in the HAVING Clause

- *List the salespeople whose average order amount for products manufactured by ACI is at least as big as that salesperson's overall average order size.*

14

## With Clause

- The **with** clause provides a way of defining a temporary table whose definition is available only to the query in which the **with** clause occurs.
- Find all departments with the maximum budget

Temporary tables are just like regular tables, except they exist only for the current session, and are dropped when the session ends.

NOTE: MySQL doesn't support **WITH** clause. Use "Create Temporary Table" instead.

15

## Scalar Subquery

- Scalar subquery is one which is used where a single value is expected
- Find the budget and the total salary for each department

Scalar subquery in SELECT clause

- Runtime error if subquery returns more than one result tuple

16
